VARIABLES AND DATA TYPES

Variable: Place we

- Name assigned to a particular data.

Data Types:

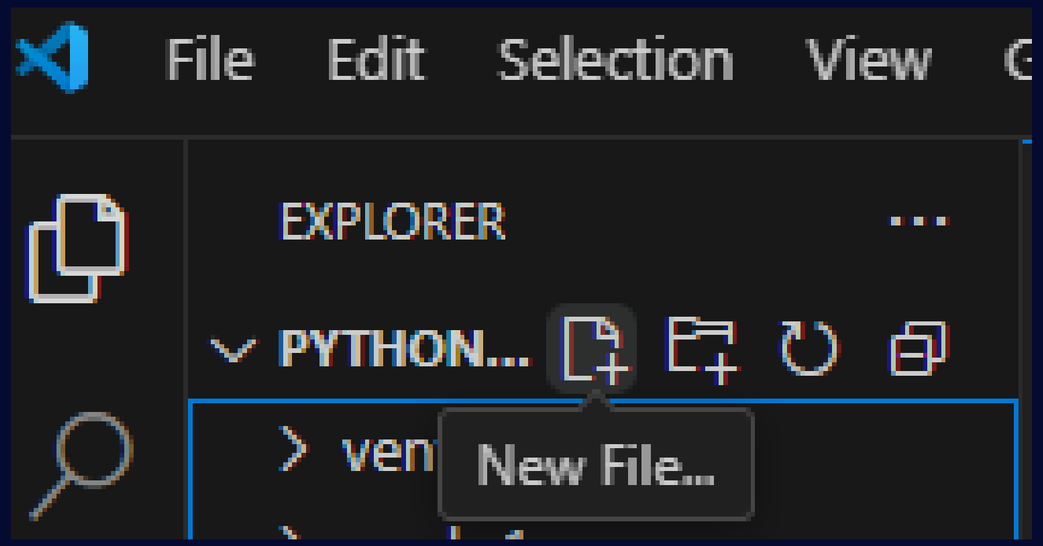
- String
- Integer
- Float decimal number
- Boolean true or false

1. Create virtual environment : python -m venv myvenv
2. Activate virtual environment: myvenv\Scripts\activate

```
(venv) PS C:\Users\admin\Desktop\README\jom_hack\python_content\week_3\crud_mongo>
```

0 ⚠ 0 Ln 40, Col 34 Spaces: 2 UTF-8 CRLF {} Python 3.11.9 (venv) Go Live Prettier

3. Create python file



4. Write python code

```python
name = "Bob"       # String
age = 10           # Integer
weight = 20.5      # Float
is_female = False # Boolean

print(name)
print(type(name))
```

5. Run python file

```
(venv) PS C:\Users\admin\Desktop\README\jom_hack\python_content\week_3\crud_mongo> python your_file_name.py
```

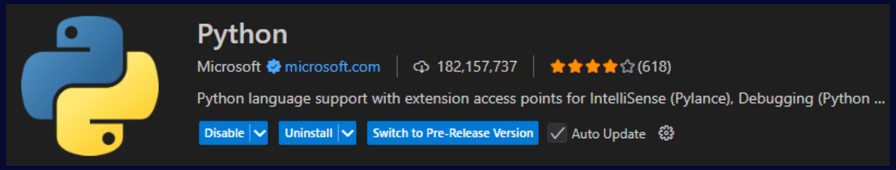
Math Operations

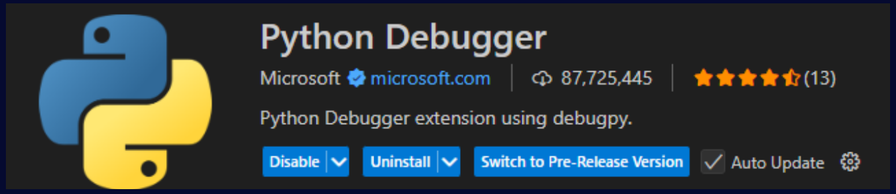
```python
x = 10
y = 3

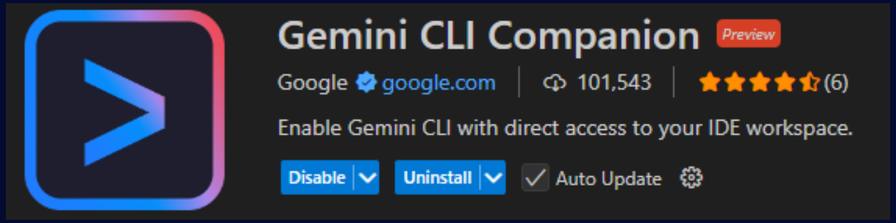
print(x + y)   # Addition
print(x - y)   # Subtraction
print(x * y)   # Multiplication
print(x / y)   # Division
print(x // y)  # Floor division
print(x % y)   # Modulus
print(x ** y)  # Exponentiation
```

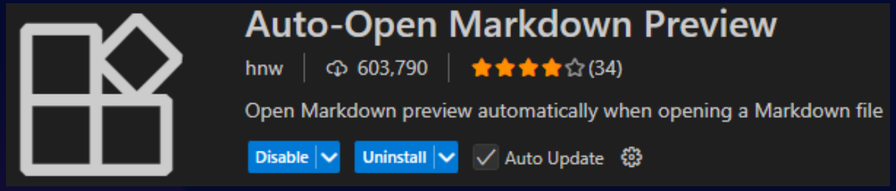
Exercise:

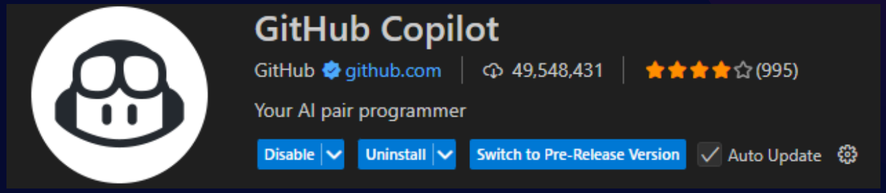
1. Create variables that consist String, Integer, Float, and Boolean data types. Print value for each key.

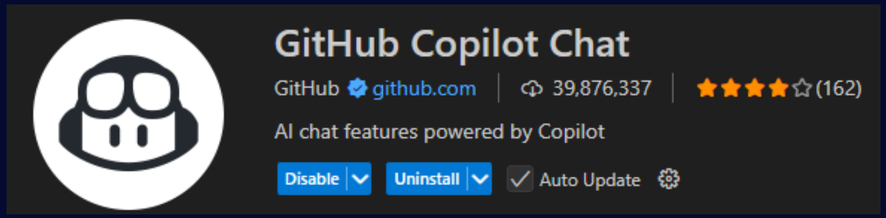
2. Convert Celsius to Fahrenheit. (F = C * 9/5 + 32)
celcius = 25


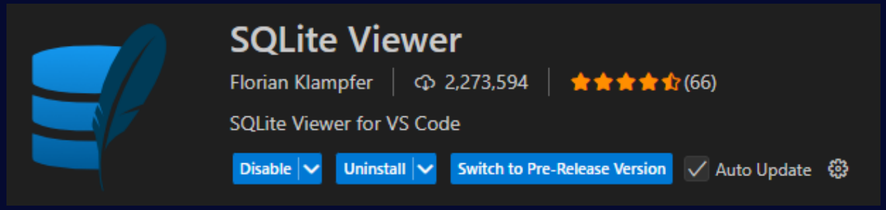












VSCode Extension (optional):
